PACE URINAL CAPS

Biological deodoriser & descaler

EXAMPLE SAVING: net saving of up to £618 per urinal/annum.

Pace Urinal Caps allow for management of uric acid and ammonia smells to be contained ensuring no future blockages occur.

A Bower water management system restricts the water flow to the urinals from a fifteen minute cycle to a once every twelve hours cycle, which generates a 98% water usage saving which is only possible due to the unique nature of the **Pace Urinal Caps** performance.

A urinal uses 315 cubic metres of water per annum (ref Thames Water figures) The UK average input and waste output water costs are *£1.99 per cubic meter = £626.85 p.a. If we assume just one blockage per annum at a cost of £100 = £726.85 p.a. (assumes no water restriction device is already installed).

**Cost of caps per urinal start at £8 each and are changed every month,
Annual cost = £96 a year.**

How does the PACE URINAL CAPS system work?

Pace Urinal Caps are a simple dosing system. The bacteria in the caps are slowly dosed into the pipe work. The bacteria are designed to break down uric salt and out populate existing bacteria that give off nasty odours. Because of this process water doesn't need to be flushed into the urinal quite so much. Once the cap is spent (4-8 weeks) - Simply replace. As part of the cleaning regime please do not use bleach or other harmful chemicals as these are counter active. **Please use Pace Liquid** supplied by MSL Ltd.

Why Pace is easier to use than other washroom water reduction methods.

Pace Urinal Caps plug into the existing urinal strainers. Turn the water off, or turn the water down, or introduce a water management system set to flush once or twice a day, reducing both your water and carbon output. This can be achieved using the Bower water management system restricted to two flushes per day, (once every 12 hours).

Standard Cap

Fits standard/flat strainers

Raised Cap

Fits raised/domed strainers
